Dermatite atopique

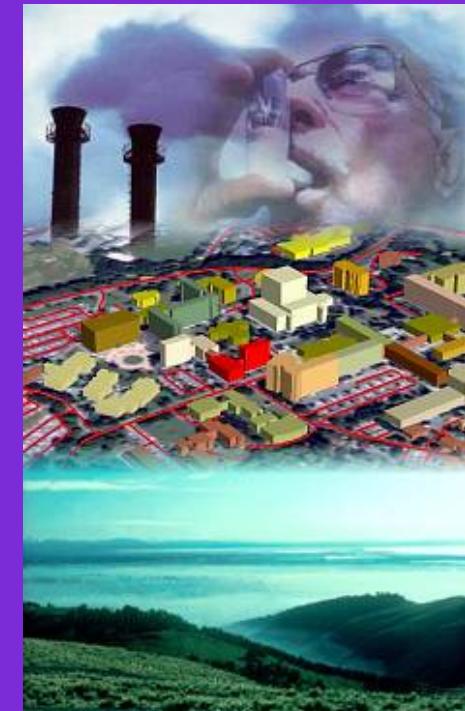

Plusieurs facteurs sont liés à cette maladie:

- génétiques
- environnementaux

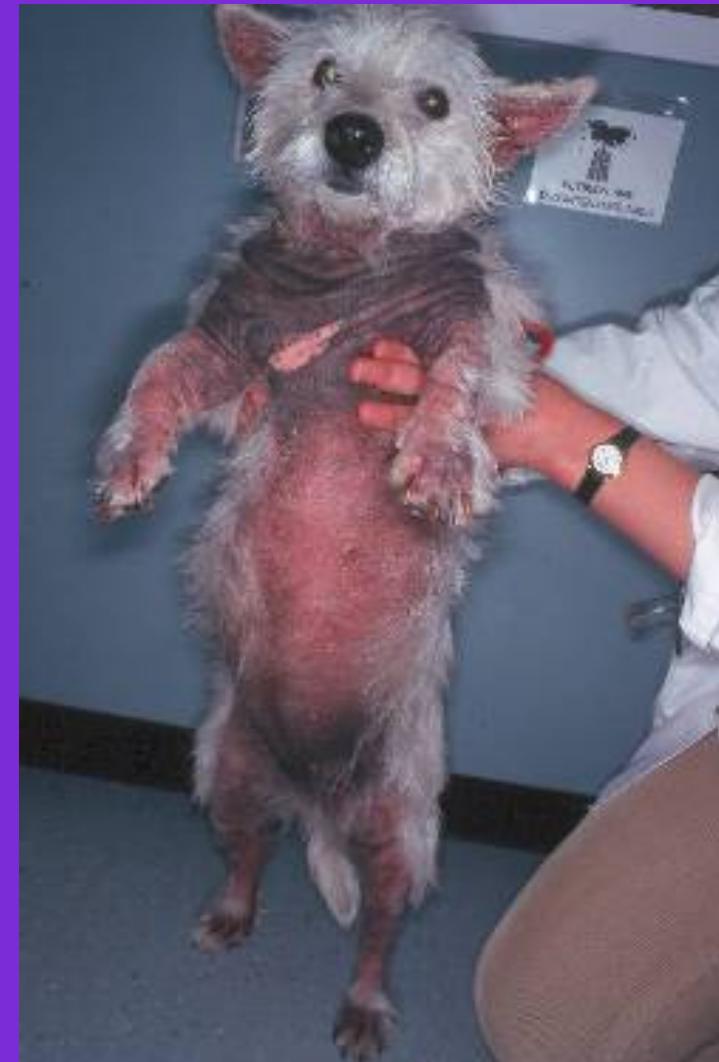

- biochimiques
- immunologiques

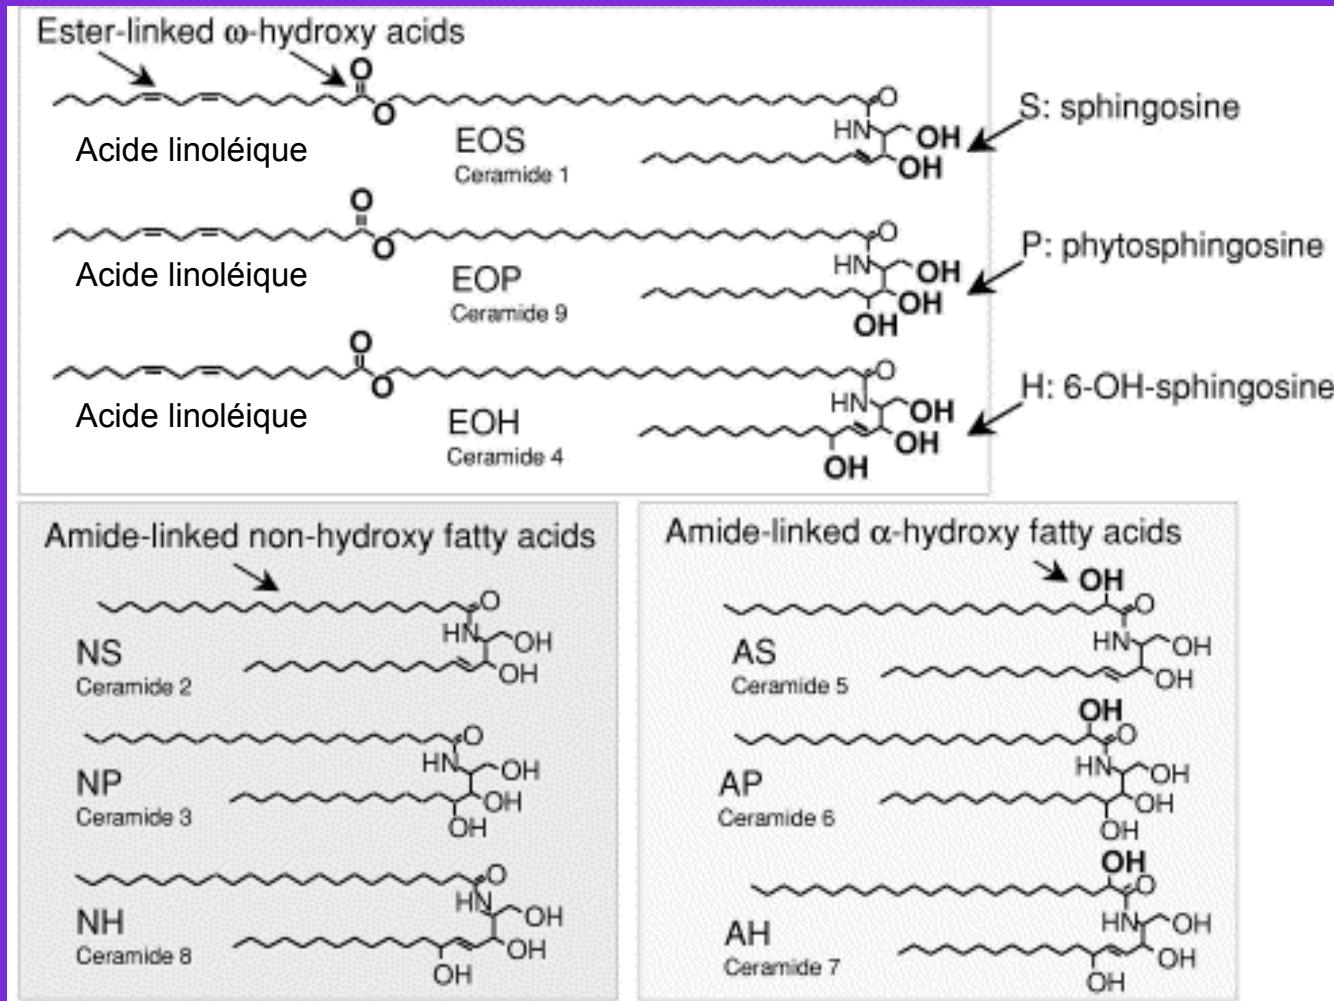

Le chien atopique : un bon modèle d'études pour la dermatite atopique humaine ?

- correspondance clinique
- apparition spontanée chez le chien

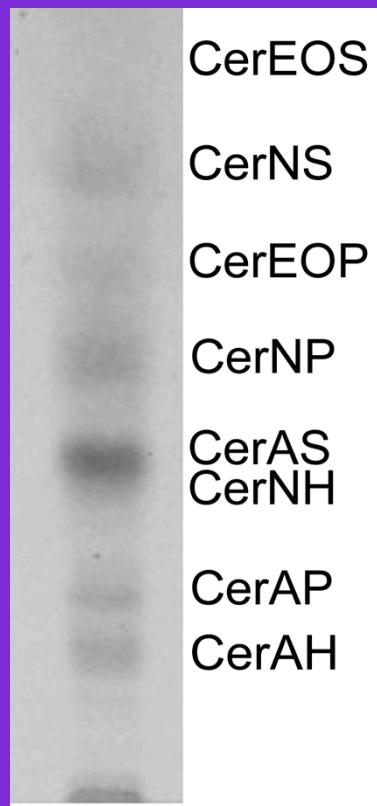

Céramides du stratum corneum humain

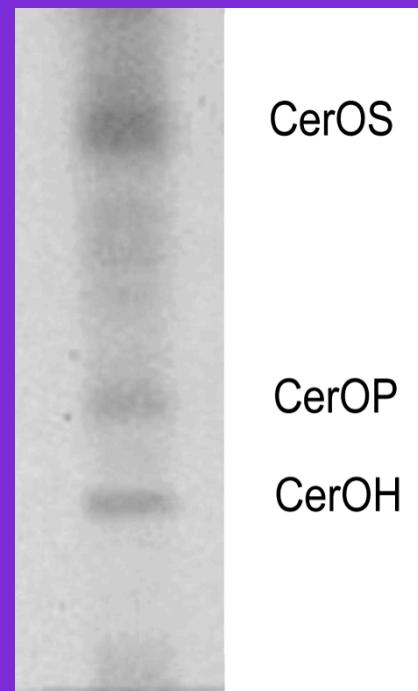

Répartition des céramides libres dans le SC humain

Cer 1 [EOS]	8%
Cer 2 [NS]	20%
Cer 3 [NP]	18%
Cer 4 [EOH]	4%
Cer 5 [AS]	17%
Cer 6 [AP]	9%
Cer 7 [AH]	12%
Cer 8 [NH]	9%
Cer 9 [EOP]	2%

Répartition des céramides couplés aux protéines dans le SC humain

Cer [OS]	62%
Cer [OP]	8%
Cer [OH]	30%

Composition en céramides libres et couplés aux protéines dans le Stratum Corneum du chien et de l'homme.

	Type de céamide	Chien	Homme
Céramides libres	Cer 1 [EOS]	3%	8%
	Cer 2 [NS]	19%	20%
	Cer 3 [NP]	28%	18%
	Cer 4 [EOH]	traces	4%
	Cer 5 [AS]	33%	17%
	Cer 6 [AP]	10%	9%
	Cer 7 [AH]	6%	12%
	Cer 8 [NH]	traces	9%
	Cer 9 [EOP]	4%	2%
Céramides couplés aux protéines	Cer [OS]	62%	59%
	Cer [OP]	8%	33%
	Cer [OH]	30%	8%

Investigation of atopic dermatitis (AD) and non-atopic canine epidermal lipids modification of expression, and organization by means of:

- Tape Stripping.
- High Performance Thin-Layer Chromatography (HPTLC).

Scotch Magic®

Methods for Skin Lipids Extraction:

1. Collection of upper Stratum Corneum (SC) by several consecutive tape strips

Extraction with

2. Collection of six consecutive scrappings followed by extraction with chloroform/methanol (*Lavrijzen et al.* 1995)

3. Collection of SC by stripping with cyanoacrylate (*Bleck et al.* 1999)

Tape stripping in combination with HPTLC to assess SC lipid:

A Extraction

B Fractionation

original sample
(contain all fractions)
dissolved in
chloroform

Fractionation
Solution
Ex:F1,F2, & F3

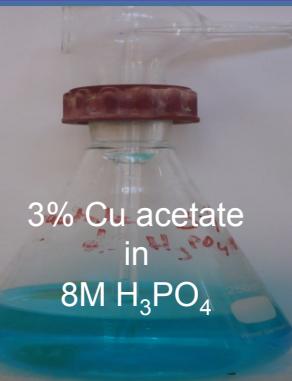

C Application with Linomat IV

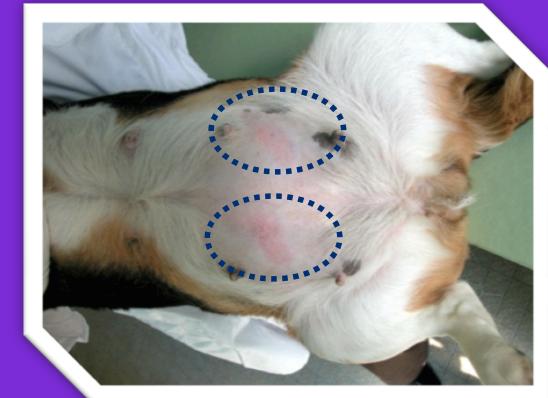

D Migration

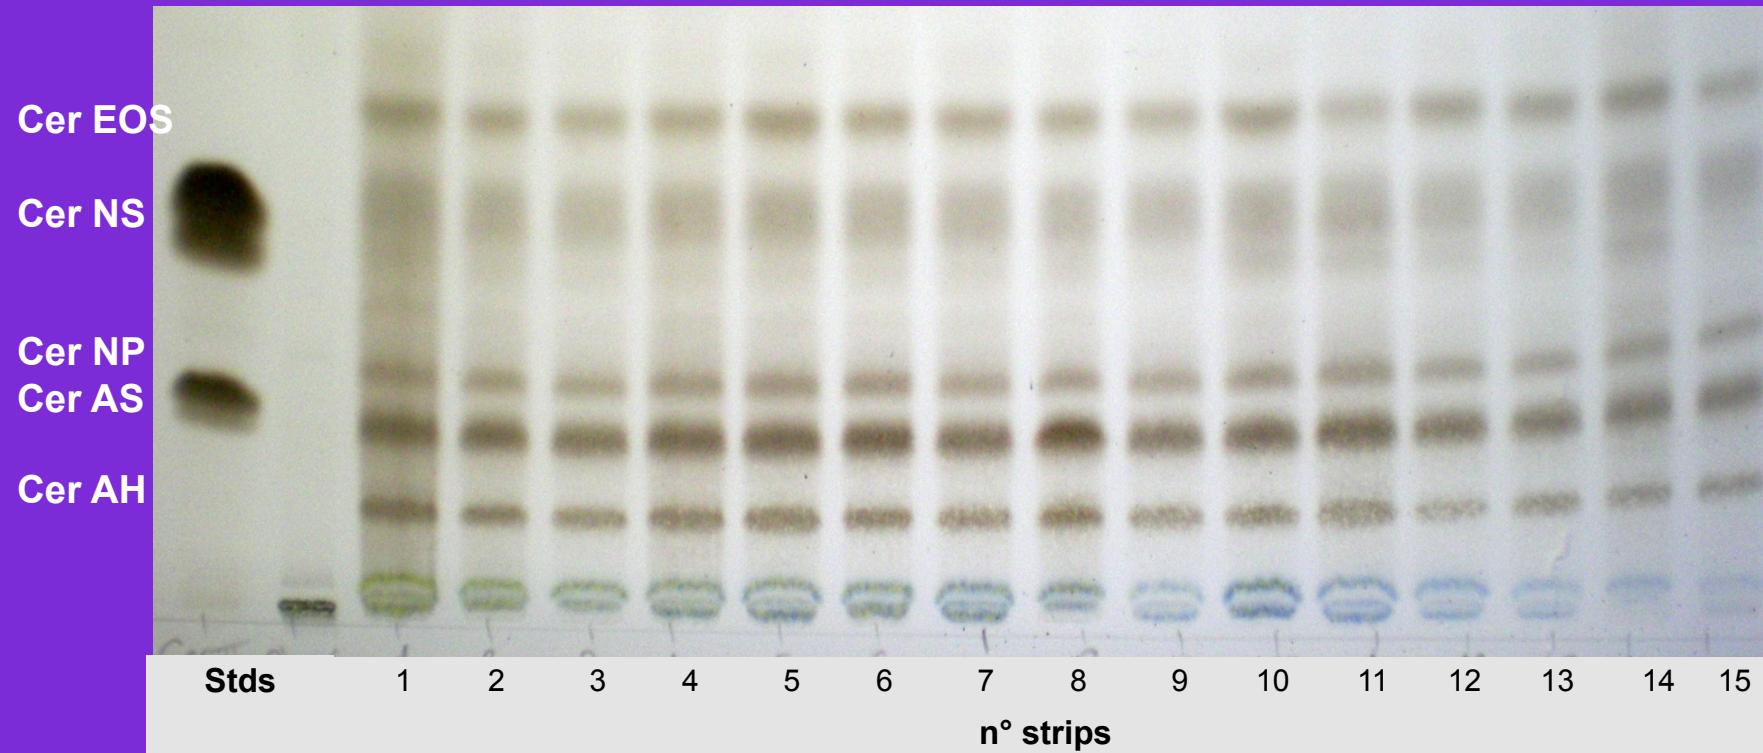

E Visualization

After
migration /visualiztion

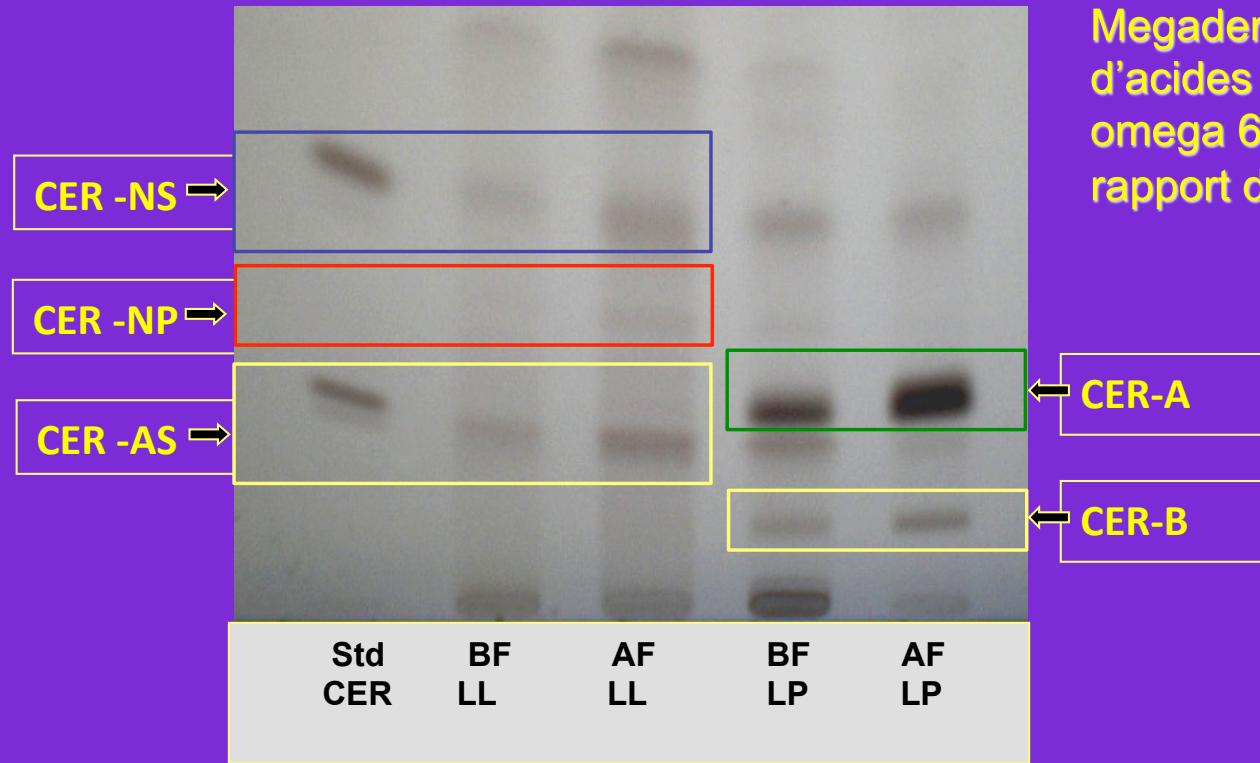

Free ceramides of healthy human Stratum Corneum

Conclusion:

The homogeneity of the stratum corneum is observed on healthy human skin
The uptake of consecutive strips shows a homogeneous distribution consistent
with an efficient barrier function .

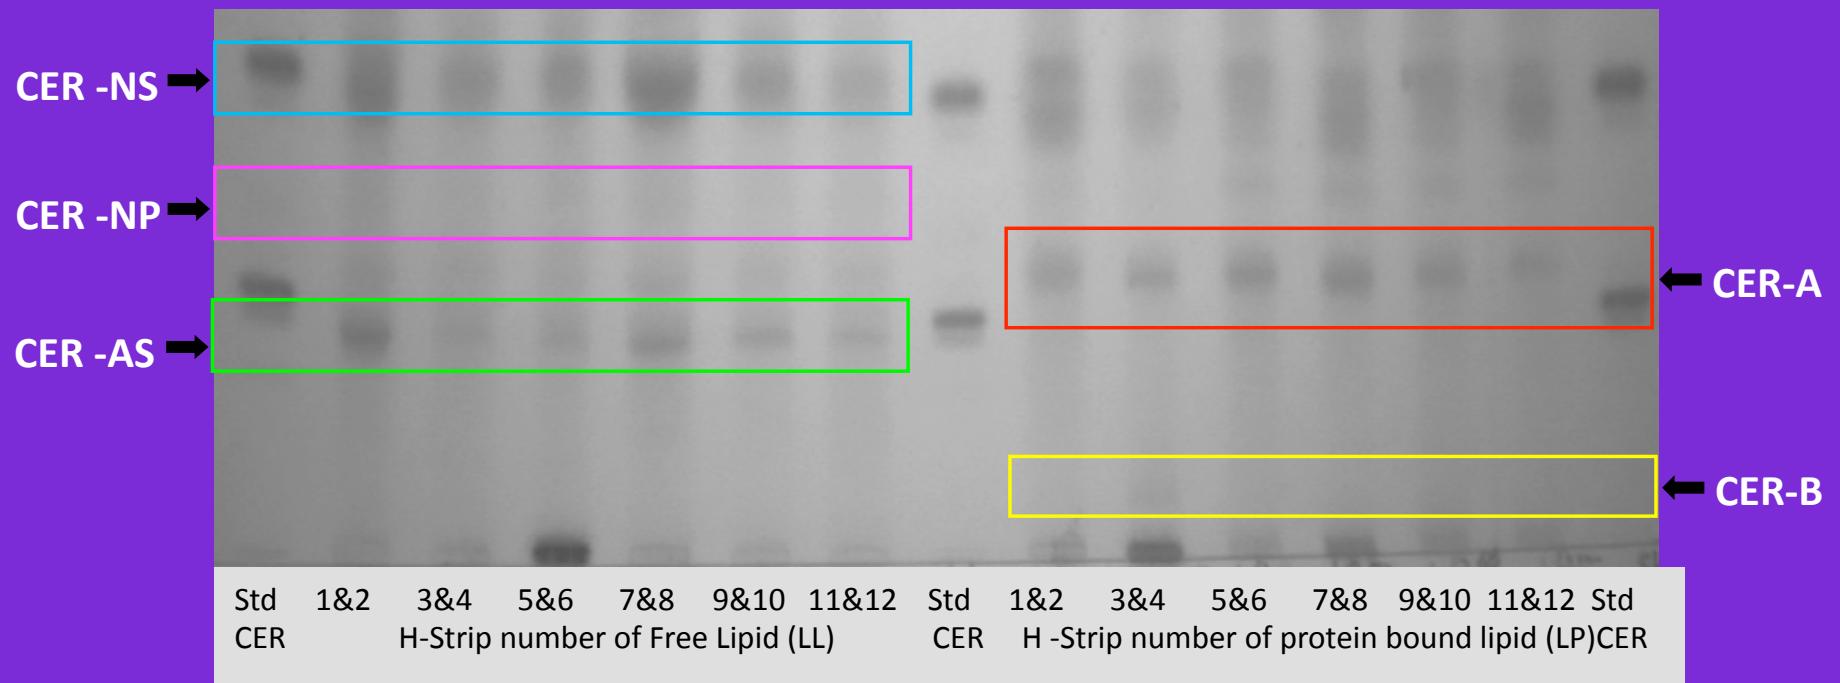

Céramides libres (LL) et liés aux protéines (LP) du chien atopique avant (BF) et après (AF) traitement oral avec Megaderm®

Augmentation globale de la quantité de céramides libres et liés
après Megaderm® → meilleure barrière cutanée

➤ Healthy Dog (2 by 2 strips)

Free Ceramides and Protein-bound ceramides

Std-CER: Standard Ceramide ;

CER-NS: Ceramide2 (normalFA- sphingosine);

CER-NP: Ceramides 3 (normalFA- phytosphingosine);

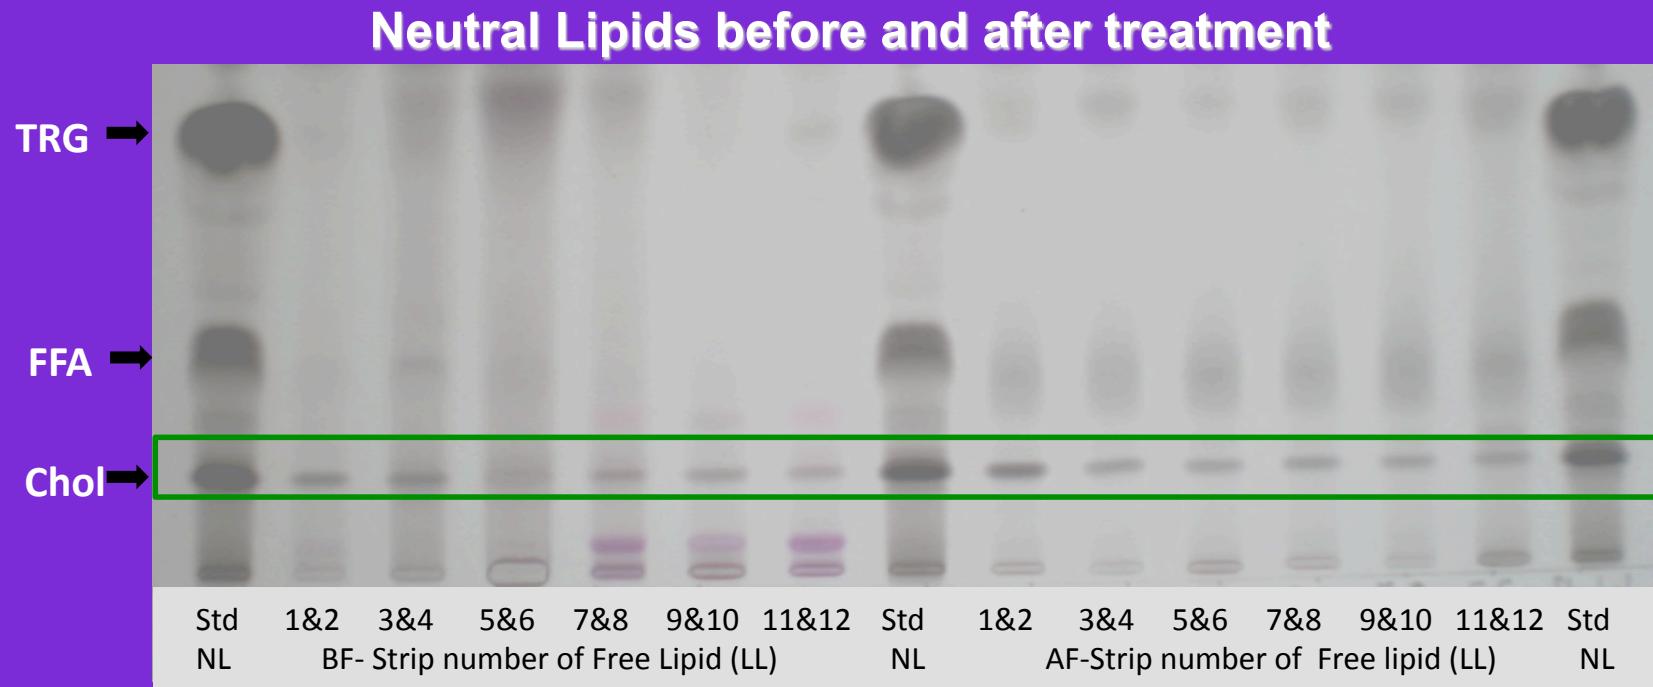

CER-AS: Ceramide5 (α hydroxyFA- sphingosine);

CER-A: covalently bound ceramides Cer (OS) sphingosine- ω -hydroxy F.A;

CER-B: covalently bound ceramides Cer (OH) 6hydroxy sphingosine- ω -hydroxy F.A.

Conclusion: heterogeneous distribution of ceramides in the strips

➤ Atopic Dog (Strips as 2 by 2)

Std-LN: Neutral Lipid (5mg/ml);

Chol: Cholesterol;

BF: before treatment;

TRG: Triglyceride;

FFA: Free fatty acid;

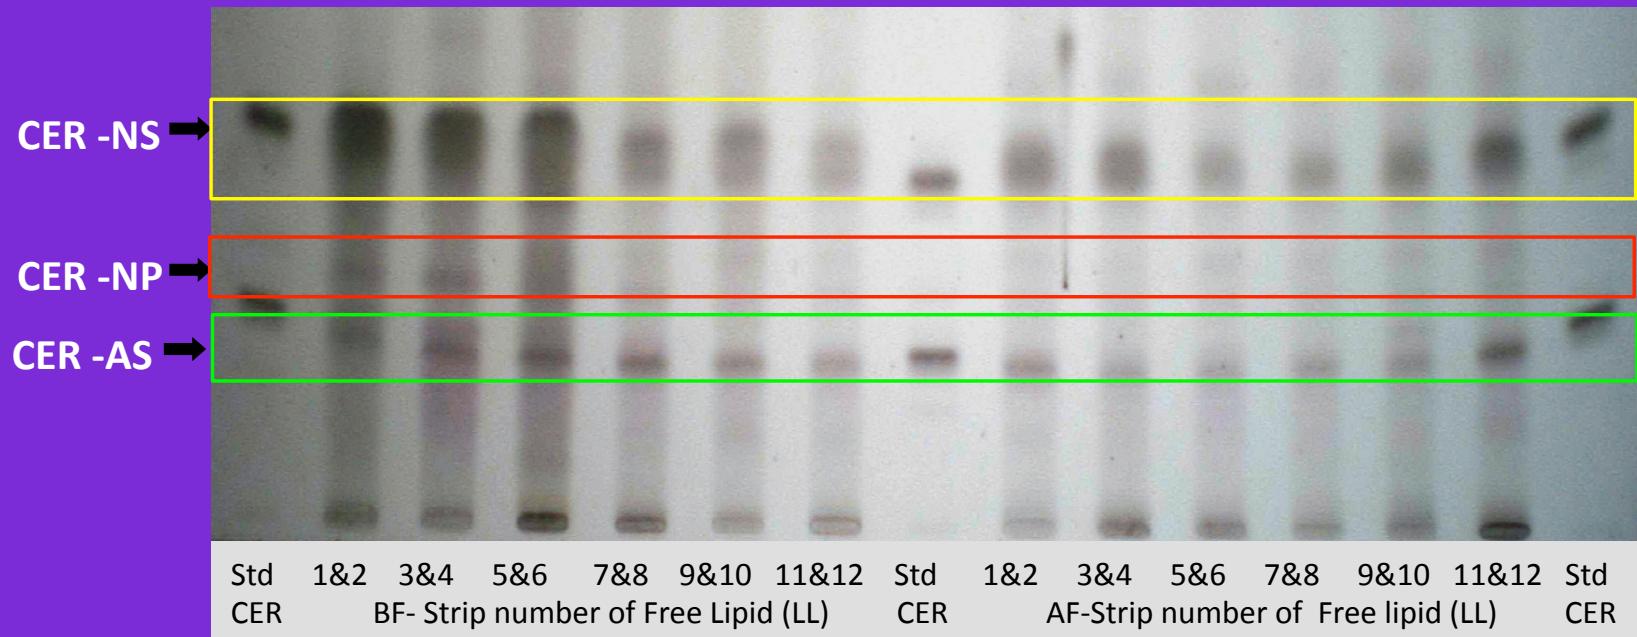

AF:after treatment.

Conclusion:

- Homogenous elevation in bands expression after treatment with Megaderm®

➤ Atopic Dog (Strips as 2 by 2)

Free Ceramides of SC before and after treatment

Std-CER: Standard Ceramide (0.25mg/ml);

CER-NP: Ceramides 3 (normal phytosphingosine);

BF: before treatment ;

CER-NS: Ceramide2 (normal sphingosine);

CER-AS: Ceramide5 (α hydroxy sphingosine);

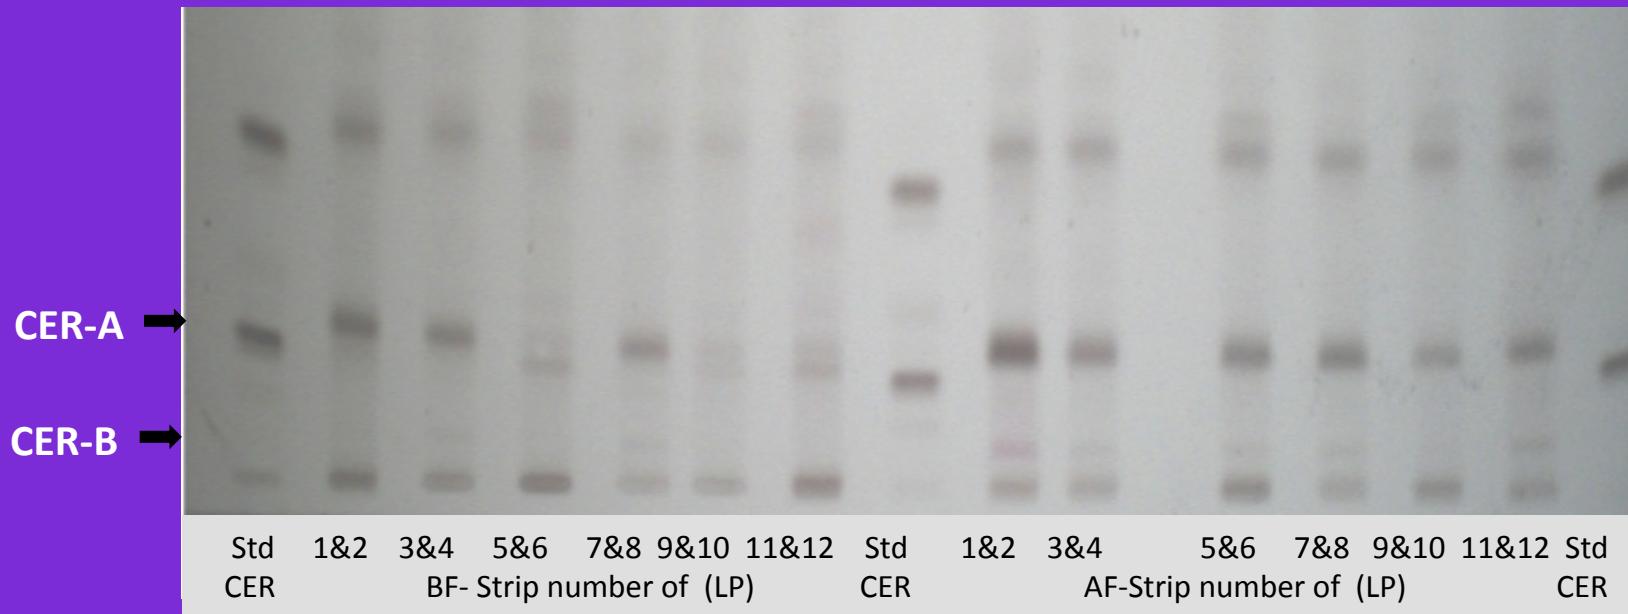

AF: after treatment.

Conclusion:

- Peculiar distribution in bands expression before treatment.
- Elevation in band expression in the deepest layer after treatment.

➤ Atopic Dog (Strips as 2 by 2)

Protein bound Ceramides before and after treatment

Std-CER: Standard Ceramide (0.25mg/ml); BF:before treatment; AF: after treatment;

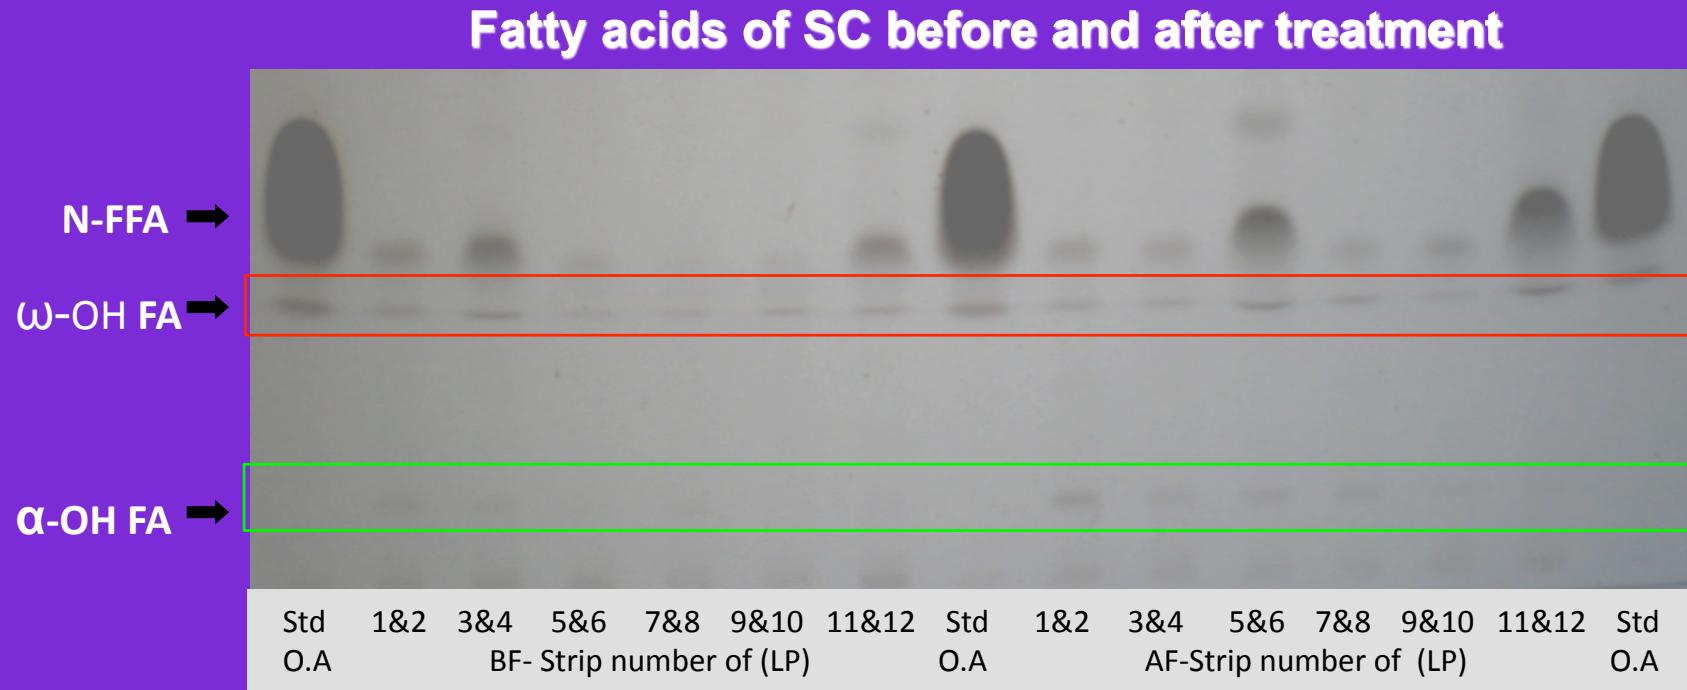

CER-A: covalently bound ceramides Cer (OS) sphingosine- ω -hydroxy F.A;

CER-B: covalently bound ceramides Cer (OH) 6hydroxy sphingosine- ω -hydroxy F.A.

Conclusion:

- Homogenous elevation in bands expression after treatment with Megaderm®

➤ Atopic Dog (Strips as 2 by 2)

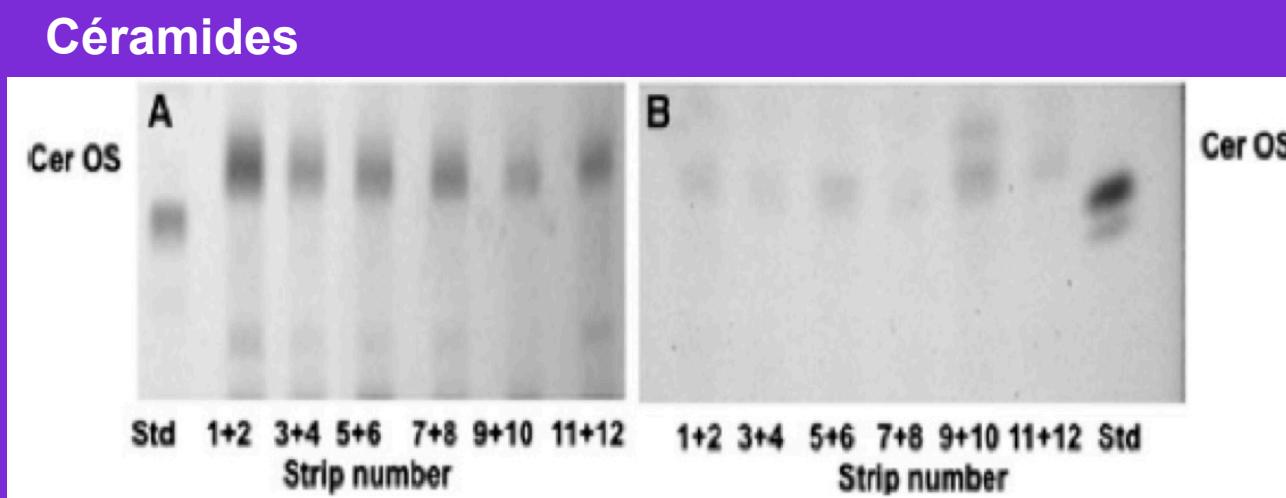

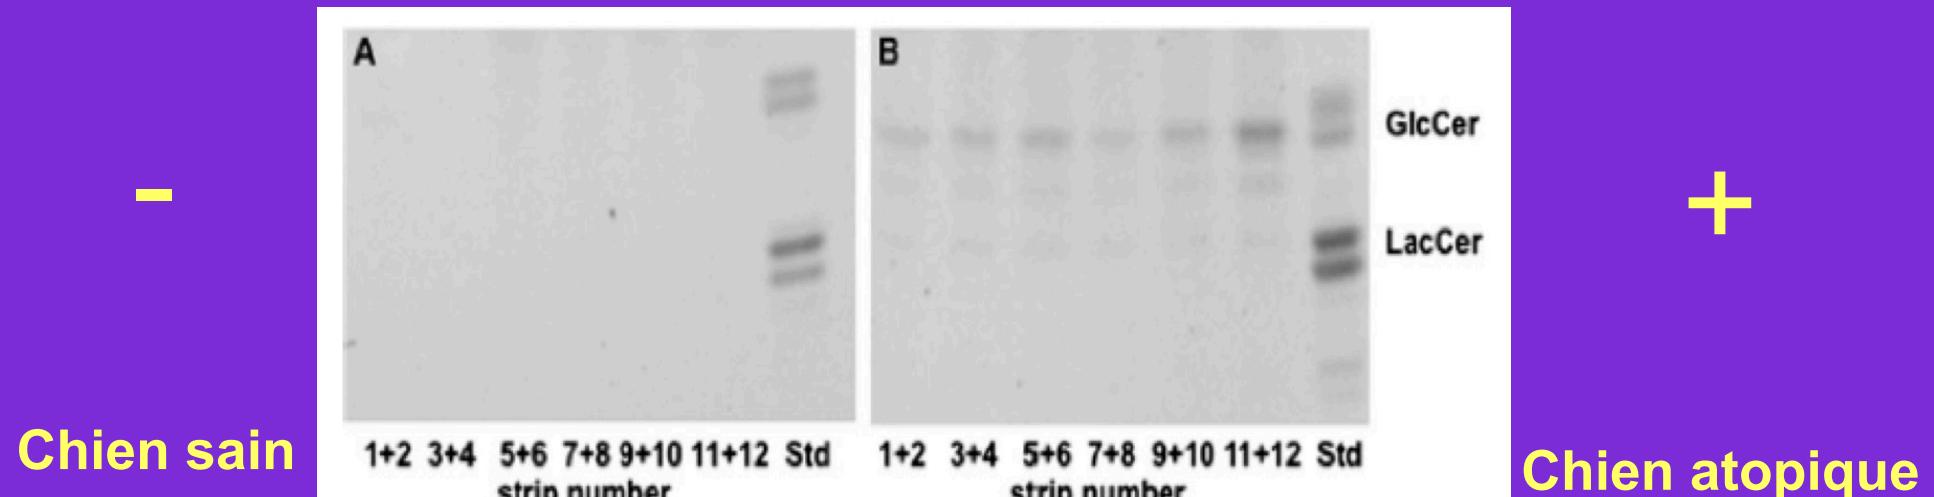

Conclusions

Elevation in fatty acids content after treatment with Megaderm®

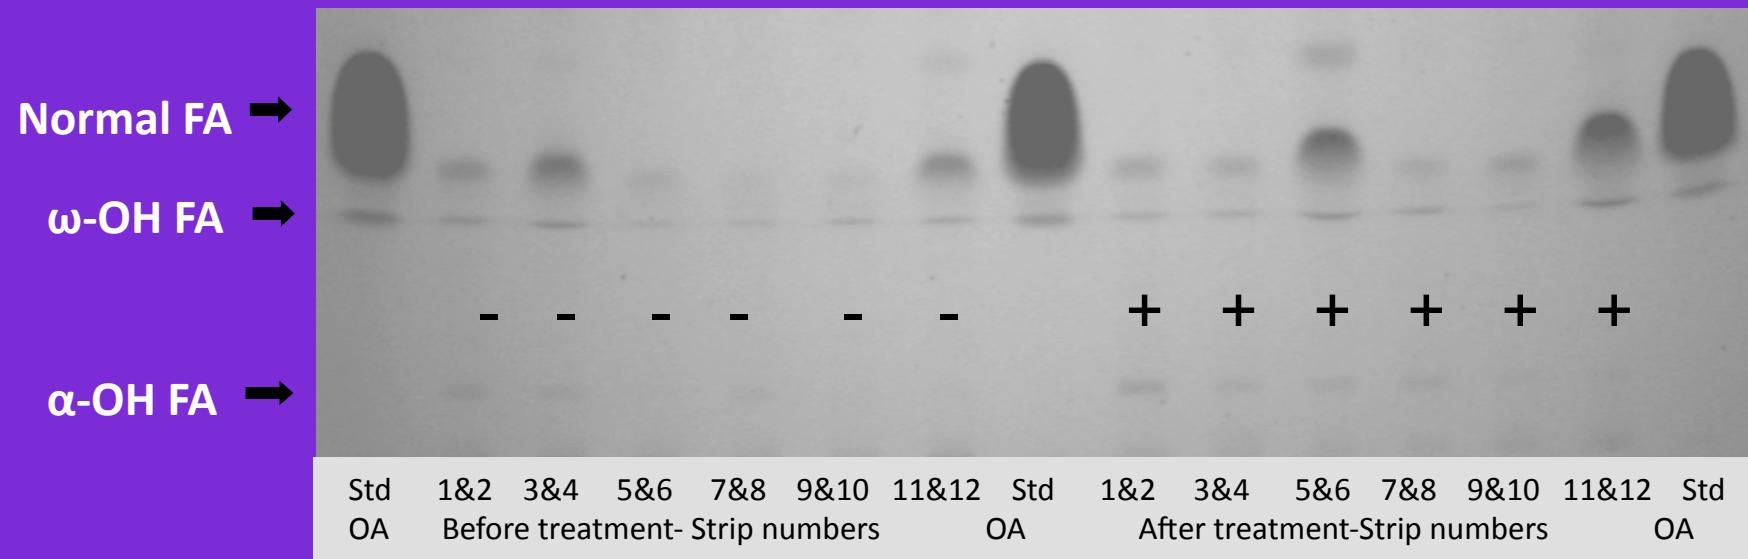

View of distribution of potein-bound fatty acids by strips pool 2 by 2.

Présence de glucosylcéramides et de céramides liés aux protéines dans les strips successifs du SC de chien

Glucosylcéramides

Acides gras liés aux protéines avant (BF) et après (AF) traitement topique avec SLC® du SC de chien atopique

OA : Acide oléique standard;

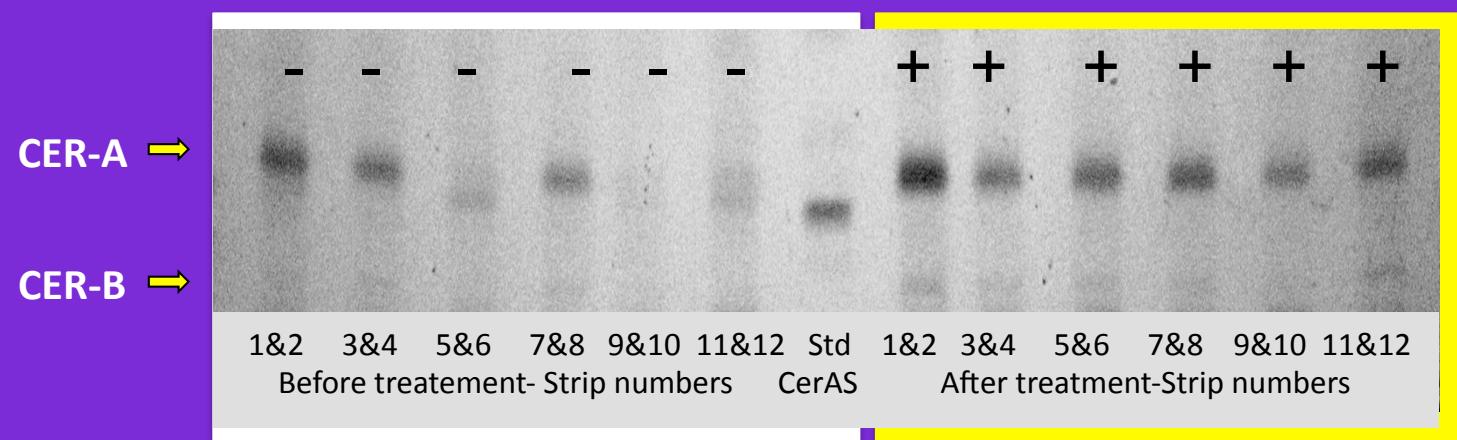

α-OH FA: Acides gras alpha hydroxylés

ω-OH FA: Acides gras oméga-hydroxylés

Augmentation des acides gras alpha et
oméga hydroxylés après traitement avec SLC

Céramides liés aux protéines dans le SC avant (BF) et après (AF) traitement topique avec SLC®

SLC® : émulsion à base de céramides, cholestérol et acides gras libres

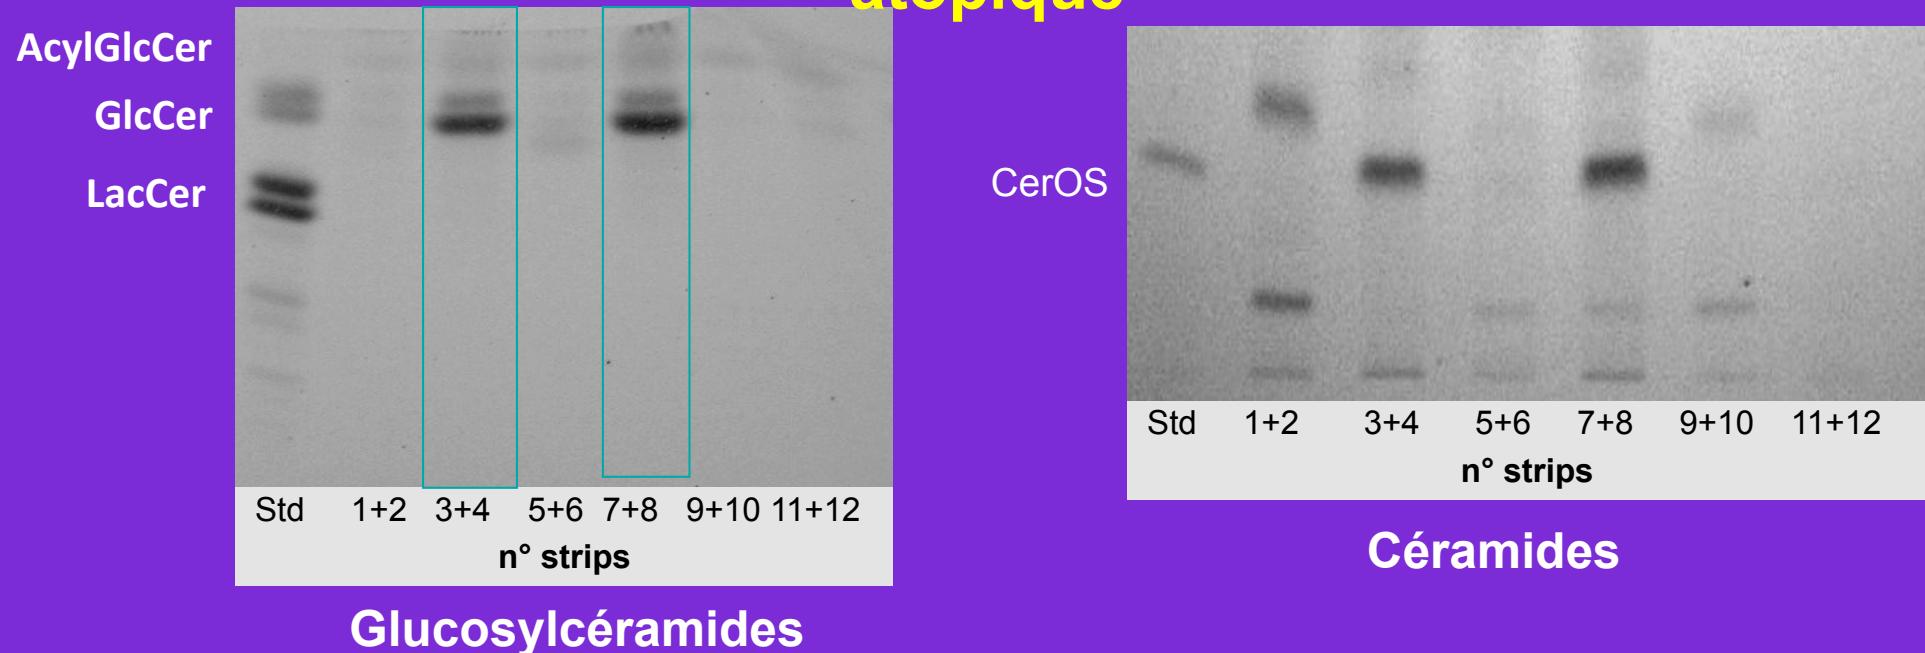

Std CerAS: Standard ceramide;

CER-A: covalently bound ceramides Cer-OS (sphingosine- ω -hydroxy FA)

CER-B: covalently bound ceramides Cer-OH (6hydroxy sphingosine- ω -hydroxy FA)

Après traitement, la répartition des céramides dans les couches successives redevient homogène et la quantité globale augmente

Répartition des sphingolipides liés aux protéines dans le stratum corneum de patients souffrant de dermatite atopique

- Les glucosylcéramides qui sont normalement absents du stratum corneum se répartissent de manière hétérogène dans les couches successives.
 - Les céramides à acides gras oméga-hydroxylés sont aussi répartis de manière hétérogène
- L'important est d'analyser la composition lipidique couche par couche**
